

## Correct grounding of the secondary distribution box

### Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). The ground resistance between all system parts shall be  $<$ . A sub panel is a secondary distribution point that receives power from the main service panel, allowing for the extension of electrical service to a remote area of a building or a separate structure like a garage or shed. Proper grounding and bonding of this secondary panel are necessary safety. The correct connection method of Distribution box grounding wire mainly includes the following steps: 1. Each DISTRIBUTION BOX and controller must be grounded. 26 mm<sup>2</sup> (10 AWG) ground wire must be used, and in all other markets a 6 mm<sup>2</sup> must be used. This helps to reduce the potential difference that exists between conductive parts and the earth. Besides, you will be able to make out other factors such as the main purpose of grounding and the pitfalls and traps that quite commonly.
