

Effective distance from network point to server rack

Overview

At a minimum, this area should extend 3 feet (0.9 m) forward from the front of the rack (4 feet/1.2 m for larger servers) and 3 feet on either side of the server when it is fully extended from the rack. Server rack spacing refers to the standardized measurements used to mount and organize equipment inside a server rack. Standardized spacing ensures that servers, switches, patch panels, and data center rack enclosures must be 48U to maximize horizontal space. The preferred width is 24 inches with vendor neutral mounting rails that are fully adjustable and compatible with all EIA-310 Electrical Industry Alliance Standards compliant with 19" wide equipment. For more information, see Requirements Specific to Perforated Cabinets. Main Distribution Area (MDA) - The central hub where core networking equipment, such as routers and main switches, are located.
