

## Hard Access and Soft Access of Switches

### Overview

Hard switching and soft switching are switching technologies used in power conversion devices such as inverters and converters, and switching power supplies. They are classified based on the relationship between current and voltage when switching on and off. Switching frequencies vary from 50 Hz in a SCR based AC-DC Phase Angle Controller to over 1. As non-geostationary satellite (LEO/MEO) moves, it eventually leaves one gateway connectivity and enters another one's. When this happens, the network must. Switching components are simple electronic switches, usually consisting of three pins, in which the presence of a voltage or current in one pin allows current to flow between the other two pins. To set the device into a state of conduction or interdiction, and therefore to conclude this procedure. In modern industrial systems, the concepts of “hard circuits” and “soft circuits” (or “hard wiring” and “soft wiring”) are commonly used to describe different methods of implementing logic control and protection functionalities.
