

Height of the circuit breaker box in the distribution box

Overview

The NEC mandates that the main breaker's height should not exceed 6'7" from the floor. This measurement, taken from the center of the grip handle on the disconnect switch to the panelboard, ensures that the breaker is easily accessible. The National Electrical Code (NEC) provides comprehensive safety standards for electrical installations, including requirements for electrical panels (main service panels and subpanels or breaker box). An electrical panel, often called a breaker box, serves as the central distribution point for electricity within a structure, housing the circuit breakers that protect the wiring from overcurrent conditions. Because this equipment is the first line of defense against electrical hazards and is used. According to the latest 2020 National Electric Code, the mounting height of breaker box should also consider the requirement that the working handle's centerline should have a maximum height of 6 feet and 7 inches or 2 meters. Any panel box installed higher than that needs a dedicated platform.
