

## High-density cold aisle space for supercomputing centers

### Overview

Q: Is cold aisle containment suitable for high-density computing deployments?

A: CAC effectively supports most density requirements up to 15-20kW per rack. Data center containment is a strategy that uses physical barriers, such as doors, ceiling panels, or curtains, to isolate hot and cold air streams within the IT environment to prevent mixing. This approach transforms traditional hot aisle/cold aisle. Supply air is delivered to the “cold aisle,” and exhaust air is evacuated from the “hot aisle. ” It is important to space these rows carefully, so that the width of the cold aisle is sufficient to deliver the required volume of air for all the racks it serves, and the width of the hot aisle is. Hot aisle and cold aisle containment are foundational concepts in data center design. When implemented correctly, they improve efficiency, reduce energy consumption, extend equipment life, and enhance overall reliability. Dominion forecasting a demand reaching 9 GW by 2035.
