The WPS button on your router is a simple method for connecting your wireless devices when you don't want to connect manually. It uses an automated protocol to get you on the local Wi-Fi network without requiring the password while your network remains secure. That's key because, as everything has become more interconnected, network security has become. Ultimately, a lot of it is about convenience, especially as we become more and more inundated with needing to remember dozens of passwords. Even with password managers, it can become a pretty frustrating task to find the SSID and re-enter a password for every device you connect with. This problem is made worse because some device interfaces are similar. That being said, there are some pretty serious concerns when it comes to WPS because brute-force attacks on a WPS device's PIN are possible. That means you should switch off WPS in your device if you aren't using it, assuming your router allows disabling it. Alternatively, check the vendor's website to see if it's patched the PIN vulnerability. You. Generally speaking, there are two primary ways to connect to the WPS devices: using a button and/or using the PIN, as mentioned earlier. The button is generally the easier of the two options, especially since it doesn't require you to find or use any sort of admin page. Instead, all you need to do is press two WPS buttons: the one on your router and. Whether you should use WPS depends on how much convenience you want. If you're concerned about your network's security, it's best to leave it turned off and connect using your Wi-Fi network's password. If you don't mind the security concerns with WPS, go ahead and use it to connect devices like printers and TVs to your network much more easily. At.
