

How to calibrate an SGV305 optical power meter

Overview

Once connected, turn on the optical power meter and let it warm up for a couple of minutes. Next, set your optical power meter to the color and power of the light. Finding ways to optimize the performance of test equipment is one of the primary issues for managers, yet maintaining a large inventory of test and measurement equipment requires a systematic and efficient approach. This makes regular calibration of test and measurement equipment one of the most. Imagine having to deal with cells of various shapes and colors (your colorimeter) that will mislead you about light as long as you don't decide for the real measure at good-scale (your holometer) calibrated. These measurements are accomplished using either collimated-beam or connectorized-fiber. We can calibrate your Fiber Optic Power Meters at two service price levels: ISO9001 or ISO/ IEC 17025 We check the cleanliness of the optical detector. If we find a performance problem with the received instrument, we will let you know. You can also ask for a linearity. Below are general answers on how to operate, maintain, and calibrate an optical fiber ranger from the list of GAO Tek's optical power meters.
