

How to ground the power distribution box on the construction site

Overview

Single-point grounding is the preferred method because it generally yields the lowest potential difference in the work zone and because it usually requires less grounding equipment and effort to install. The protective grounding system, which includes conductor grounds and worker bonding, must be engineered to protect workers from hazardous voltages that can be created by line reenergizing, lightning, or induced voltage. If more than one crew is working independently on the same deenergized line or. Effectively managing temporary power safety on any construction or demolition job site is a non-negotiable responsibility for every qualified electrician. My standard response to those questions is, "What is required by the OSHA regulations?"

" I know some people do not like to.
