

Should surveillance use multimode or single-mode fiber optic cable

Overview

This guide provides a clear, engineer-level explanation of single mode vs multimode fiber, plus practical recommendations, application scenarios, and expert purchasing advice from our CCIE/HCI-certified team. By the end, you will know exactly which fiber type suits your network. Unlike copper cables, which rely on electrical signals, fiber optics use pulses of light to transmit data—offering unmatched bandwidth, low interference, and long-distance capabilities. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types. There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. These differences determine which transceivers work with which fiber and how far signals can travel. Understanding the compatibility constraints prevents costly downtime and troubleshooting. Fiber optic cables carry information as light pulses, not electrical signals.
