

Three-level distribution box technology

Overview

Three level distribution box: a distribution box is set under the main distribution box, a switch box is set under the distribution box, and electrical equipment is set under the switch box to form a three-level distribution box. In a newly constructed residential area, a 10kV power line is introduced into the substation. After stepping down the voltage through the transformer's low-voltage side (0. These boxes feature bottom entry and exit cables, front-opening doors, and main busbars connected with copper strips for optimal contact. From there, it is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes. This video details the design standards of this red construction site distribution box, its internal breaker configuration, and how to ensure electrical safety during construction.
