

Where are company network cabinets usually located

Overview

They are typically found in telecommunication rooms, data centers, and server rooms. The primary purpose of a network cabinet is to protect the equipment housed inside and ensure proper working conditions. These cabinets are enclosed containers with a frontal and rear door, and sides that are equipped with proper ventilation systems along. A network cabinet is a special box that holds your IT gear, like servers, switches, routers, and patch panels. Server rack is most commonly use in data center environments, but you can also found it in smaller. Today, manufacturers are designing data equipment rated at 75W and 150W per square foot, and even higher because server vendors are introducing equipment as small as 1U in height- particularly with servers aimed at the Internet Service Provider (ISP) market.
