

Why use pre-fabricated pigtail plates

Overview

Product can be prefabricated even during project hold-ups due to weather, delays by other trades, etc. Reduced construction schedule equates to reduced onsite liability Minimizes onsite safety hazards caused by scrap wire and cable Reduces jobsite cleanup Forces planning and coordination Produced. Has anyone been using these regularly, such as the Term-A-Nut by Ideal?

If so, how costly are they versus time saved?

I always try to have my receptacles pre-tailed by rough-in and this looks like a definite time-saver (especially for grounding screws). For the most part, I try to use screw-down. Simplify your next installation with Hubbell's electrical prefab design specification resources. This page brings together all the tools and resources you need to design and specify with confidence. If you splice through the outlet screws and one outlet goes down, every other outlet down the chain will go down and you'll have to. Can anyone see a downside in pre-wiring outlets back at the shop with 6" stranded, 12g pigtails?

Every turn of a screw that I can do at the shop instead of in the field improves quality and saves time.
